

Email Security for Microsoft 365

{ The Perfect Pair }

Because Encryptics for Email™ integrates seamlessly with Microsoft Office 365™, you can enjoy all the advantages of cloud services while securing your data with device-level encryption.

Adding Encryptics for Email to your existing Microsoft® email solution enables your organization to send corporate IP (intellectual property), customer data, legal documents, financial records, and more anywhere in the world—without ever having to worry about security.

With a convenient Encryptics Add-In for Outlook®, you can secure important messages using the familiar Microsoft email client. Messages (including attachments) that contain sensitive content will be encrypted at the device level as soon as you hit Send. This way, sensitive content is never “up for grabs” as it travels to its destination.

Best of all, you maintain control of your messages, even when they reside on email servers and recipient devices outside of your managed network. With Data Rights Management (DRM), recipients are not able to access, alter, export, or share your messages unless you allow it.

{ Added Value }

When you add Encryptics for Email to your Microsoft email solution, you won't have to trade convenience for security. You'll have both.

End-to-End Email Security

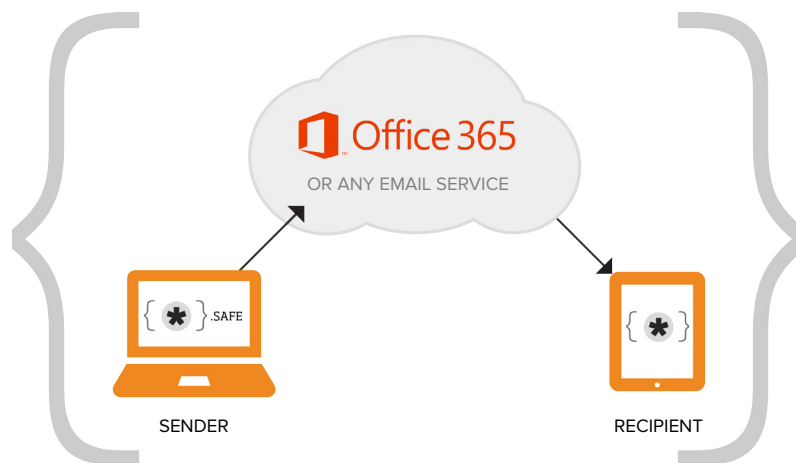

- ✦ Device-level encryption
- ✦ Patented data protection
- ✦ Data Rights Management
- ✦ Policy Based Protection

Seamless Microsoft Integration

- ✦ Familiar Outlook interface
- ✦ Uninterrupted workflow

Cost Effective Solution

- ✦ Software-based solution
- ✦ No additional hardware needed
